About VerisoftDriver

VerisoftDriver is a wrapper for the WebDriver interface. You can investigate more in the VeriSoftDriver Javadoc. It implements the WebDriver interface, as well as a few other Selenium interfaces: `JavascriptExecutor`, `HasCapabilities`, `HasVirtualAuthenticator`, `Interactive`, `PrintsPage`, `TakesScreenshot`, and `WrapsDriver`.

VerisoftDriver is also a superclass for the VerisoftMobileDriver

In its essence, the VerisoftDriver serves as a thin wrapper, which provides verbose logging for the WebDriver activity and allows its user to perform the following tasks:

a. Define and execute async operations

b. Add custom listeners using the WebDriverListener mechanism

Note! In the Verisoft roadmap the VerisoftDriver object will be replaced by the Selenium 4 Decoration mechanism.
